Henry, Lucy A and Wilcock, Rachel and Crane, Laura (2017). *Access to justice for children with autism spectrum disorders*. [Data Collection]. Colchester, Essex: UK Data Archive. [10.5255/UKDA-SN-852471](https://beta.ukdataservice.ac.uk/datacatalog/studies/study?id=10.5255/UKDA-SN-852471)

The remainder of the data will be uploaded on publication to the same site.

Acknowledgements. We would like to express our thanks to the Registered Intermediaries who contributed their invaluable expertise and advice to this project, Jan Jones and Sharon Richardson; the barristers who cross-examined the child witnesses; and those who offered specialist police advice (Mark Crane), help with testing (Richard Batty, Marialivia Bernardi, Debbie Collins, Zoe Hobson, Rosie Protheroe, Mimi Kirke-Smith, Genevieve Waterhouse) and extensive help with data coding (Debbie Collins, Frances Beddow). Finally, our heartfelt thanks to the schools, teachers, parents and children who kindly assisted with the research. This work was supported by the Economic and Social Research Council [grant number: ES/J020893/2].

**Intermediaries and cross-examination resilience in children: The development of a
novel experimental methodology**

Experimental studies examining child ‘witnesses’ under cross-examination typically rely on researchers questioning children using a ‘barrister’s script’. In the current research, experienced barristers used a defence statement from a mock perpetrator (who committed a theft 11 months earlier) to challenge typically developing children’s evidence under cross-examination. We also assessed whether Registered Intermediaries (RIs), trained professionals who facilitate communication between vulnerable witnesses and members of the justice system, help children reduce compliance with misleading cross-examination suggestions. Results demonstrated that children (6-11 years) complied with barristers’ challenges to a high degree: 94% agreed with at least one of the barristers’ seven false suggestions. However, when assisted by an RI, children were significantly less compliant with barrister challenges. These findings, and additional analyses of the nature of child responses and barrister questions, provide novel exploratory evidence for the beneficial role of RIs in tempering the adverse effects of cross-examination style questioning for children.

Keywords: cross-examination, barristers, child witnesses, Registered Intermediaries, court

Introduction

In adversarial justice systems, such as England and Wales, child witnesses in criminal trials provide their evidence-in-chief (direct evidence) via video-recorded Achieving Best Evidence investigative interviews (Ministry of Justice, 2011). Subsequently, they may be questioned on this evidence by the opposing counsel ('cross-examination'), who has an interest in undermining this evidence. This can mean that witnesses, "having first been questioned by someone who wants them to say one thing...are then cross-examined by another person who wants to make them say the opposite" (Spencer, 2012, p.1). Here, we report the development of a novel experimental methodology to investigate cross-examination performance in typically developing children. We also assess whether providing child witnesses with a 'Registered Intermediary' (RI; a trained professional who facilitates communication between vulnerable witnesses and members of the justice system, Ministry of Justice, 2020a) improves the quality of children's evidence, by reducing compliance with barrister challenges about false information.

Recommendations of the Pigot Committee (Home Office, 1989) led to legislation in England and Wales that enabled, with the agreement of the court, vulnerable and intimidated witnesses to benefit from 'special measures' (Youth Justice and Criminal Evidence Act, 1999). These included: screens (preventing the witness from seeing the defendant); live links (enabling the witness to give evidence during the trial from outside the court room via a televised link); the removal of wigs and gowns (by judges and barristers); pre-recorded video evidence-in-chief and cross-examination; use of aids for communication (enabling questions or answers to be communicated to or from the witness); and examination of the witness assisted by an RI. Although most of these recommendations have since been fully

implemented in England and Wales (the jurisdiction relevant to the current study), live-link cross-examinations were retained¹.

Improving the quality and reliability of children's evidence under cross-examination is an urgent international priority given serious concerns about how child witnesses are treated in criminal courts (e.g., Andrews, Lamb, & Lyon, 2015a; Spencer, 2012; Zajac, O'Neill, & Hayne, 2012). Studies of court transcripts (e.g., Australia, England, New Zealand, Scotland, USA) highlight that large proportions of questions posed to children during cross-examination are inconsistent with best practice guidelines and developmental level, with heavy reliance on closed, option-posing, suggestive (leading), repeated, and complex questions (e.g., Andrews & Lamb, 2016; Andrews et al., 2015a; Andrews, Lamb, & Lyon, 2015b; Evans, Lee, & Lyon, 2009; Hanna & Henderson, 2018; Hanna, Davies, Crothers, & Henderson, 2012; Henderson & Lamb, 2019; Henderson, Andrews, & Lamb, 2019; Klemfuss, Quas, & Lyon, 2014; Zajac, Gross, & Hayne, 2003; Zajac & Cannan, 2009). Suggestive questions are particularly problematic, as the likelihood of errors increases with their use (Lamb, Malloy, & La Rooy, 2011). Such questions "should only be used as a last resort and only when necessary (e.g., to immediately safeguard a person)" (Bull, 2010, p. 9), yet they are commonly *recommended* to advocates to maintain control of the discourse (Hanna et al., 2012). This illustrates the conflict between the aims of cross-examination (to test evidence) and best practice guidelines (to elicit evidence) (Zajac et al., 2012). Indeed, some have called cross-examination "a virtual 'how not to' guide to investigative interviewing" (Henderson, 2002, p. 279), directly violating methods that promote

¹ In 2014, a pilot programme of video-recorded live-link cross-examinations in England was trialled (Baverstock, 2016), involving pre-trial Ground Rules Hearings (which can place restrictions on traditional cross-examination practices to improve witness experiences) and video-recorded cross-examinations (to reduce delays between giving initial evidence and cross-examination in court). The scheme has now been rolled out to all Crown Courts across England and Wales. Henderson et al. (2019) and Henderson and Lamb (2019) evaluated cases with and without pre-trial Ground Rules Hearings prior to pre-recorded children's cross examination. With these measures, fewer suggestive questions were asked, and question complexity was reduced.

completeness and accuracy (Zajac et al., 2012) and exploiting children's vulnerabilities (Henderson et al., 2019). Almost 90% of witnesses under 11-years do not understand questions they are asked at court (Plotnikoff & Woolfson, 2009). Further, almost 95% of cross-examination transcripts of child sexual abuse cases reveal inconsistencies, largely between what is said in police interviews relative to subsequent cross-examination (Pichler et al., 2020). Worryingly, a comparative study of child sexual abuse case transcripts in Australia found no improvements in the format of questions used over the past 60 years (leading questions still predominated), with *more* questions asked, which were *more* likely to be complex (Zajac, Westera, & Kaladelfos, 2018).

Empirical studies of cross-examinations support these findings, noting that high numbers of children change their responses following questioning. In children of 4-11 years, 70-98% changed at least one aspect of their testimony when challenged (e.g., Bettenay, Ridley, Henry, & Crane, 2014; Righarts, Jack, Zajac, & Hayne, 2015; Zajac & Hayne, 2003, 2006; Zajac, Jury, & O'Neill, 2009). Most previous empirical studies employed researchers challenging witnesses by asking scripted cross-examination questions, although occasionally trainee legal professionals have been used (e.g., Bettenay et al., 2014). Yet, it is more realistic to allow barristers free reign to tackle cross-examinations in the way they see fit. In the present study, an unscripted approach was used to assess cross-examination compliance in children, enabling barristers to adapt according to the way a child responded, and to press points more emphatically if they were making headway, which is not possible using a script.

The study also investigated whether one of the special measures, the Witness Intermediary Scheme (available in England and Wales since 2004), would help reduce child witnesses' compliance with barrister challenges about false information. The role of RIs is wide-ranging but includes assessing the communication abilities of vulnerable witnesses and offering impartial and specific advice on posing best practice questions by accommodating

each individual child's language and communication needs. The aim is to facilitate communication between the child and relevant professionals to ensure it is complete, coherent and accurate (Collins & Krahenbuhl, 2020; Krahenbuhl, 2019; Cooper & Wurzel, 2014). Several other international jurisdictions (e.g., Northern Ireland, New Zealand, Norway, New South Wales, Australia) have adopted intermediary schemes, although details of the schemes vary (see Cooper & Mattison, 2017; Cooper & Wurzel, 2014; Taggart, 2021). Feedback on the RI scheme has been generally positive (Collins & Krahenbuhl, 2020; Ministry of Justice, 2020a; Plotnikoff & Woolfson, 2015), and mock juror studies suggest that the presence of an RI does not have a negative impact on perceptions of child witnesses (e.g., Krahenbuhl, 2019). However, further empirical evidence in relation to RI use during mock cross-examinations is needed and the current study offers exploratory evidence in this regard.

The current study forms part of a broader research programme examining child witness performance during all stages of a mock criminal investigation: initial statements (Henry, Messer, Wilcock, Kirke-Smith, Hobson, & Crane, 2017a); investigative interviews (Henry, Crane, Nash, Hobson, Kirke-Smith, & Wilcock, 2017b); identification line-ups (Wilcock, Crane, Hobson, Nash, Kirke-Smith, & Henry, 2018; 2019); and cross-examinations (presented here). Children viewed a staged event involving a minor mock crime (in which one man 'stole' another man's phone or keys) and were cross-examined on this evidence approximately 11 months after undergoing initial investigative interviews (representing close to the average delay of eight months for a case to go to trial in England and Wales at the time of the study; Plotnikoff & Woolfson, 2012). Qualified, experienced barristers took on the role of the defence barrister and were presented with a defence statement with which to question the children, allowing the barrister to adopt an unscripted approach.

The first primary research question was whether, and to what extent, children would comply with the barrister's challenges on seven elements of false information in the statement. A second primary research question considered whether providing child witnesses with RI assistance reduced compliance with the barrister's challenges on this false information (a proportion of our sample was assisted by a fully qualified, experienced RI at all stages of giving formal evidence). Given the lack of previous empirical evidence, predictions were tentative. We hypothesised that: (1) children would comply to a large degree with barrister challenges on false information; and (2) a beneficial effect of RI assistance on compliance with false information on cross-examination challenges would emerge, as RIs facilitate communication, for example, rephrasing questions in a developmentally appropriate manner in line with an individualised communication assessment. Two subsidiary research questions were also addressed: (3) in RI assisted cross-examinations, would children's responses show less compliance (and more resistance) to challenges on false information?; and (4) in the RI condition would barristers change the style and nature of questions in line with the recommendations given for questioning (based on each child's communication assessment and according to best practice for interviewing young children)? We tentatively predicted that children in the RI condition would be less likely to comply with, *and* more likely to resist, challenges on false information; and that barristers would ask more questions in the RI condition consistent with best practice. The broader research programme included a control interview condition (Best-Practice) and two other interview conditions (Sketch-Reinstatement of Context and Verbal Labels). We did not expect the two other interview conditions to differ from the Best-Practice condition in terms of cross-examination resistance or nature of responses/questions.

Method

Participants

A total of 202 typically developing children were recruited from mainstream primary schools in London and the Southeast of England, but three were excluded: one had a full-scale IQ in the intellectual disability range; and two were unavailable for the investigative interview (see Henry et al., 2017a, for further details). Of the remaining 199 children, 177 (84 boys, 93 girls) were available for cross-examination 11 months later (range 8-13 months). At this stage, one further child (a girl) was excluded because she did not respond to any cross-examination questions. The remaining 176 children ranged in age from 6 years 7 months to 11 years 3 months (mean = 8 years 6 months, SD = 1 year 2 months) at the time of the initial investigative interview; and 7 years 7 months to 12 years 3 months (mean = 9 years 5 months, SD = 1 year 2 months) at the cross-examination stage. See Table 1 for details.

[insert Table 1 about here]

Materials and Procedure

As described, this research was part of a wider project exploring the performance of child witnesses across different stages of the criminal justice process (children on the autism spectrum were included, but we were unable to cross-examine enough children to ensure reliable findings with this group). Of relevance to the current paper, were three phases.

Phase 1 – Staged event and evidence gathering statements (‘Brief Interviews’).

Children watched a staged event (either live or on video²) of two men delivering a short talk about what school was like a long time ago. As well as telling the children a series of facts about Victorian schooldays and showing them some equipment (e.g., an abacus, a slate), a minor theft occurred in which one of the men ‘stole’ the other’s keys/phone³. For ethical

² 144 children saw the event live and 32 children saw it via video. A *t*-test on number of correct details recalled in the brief evidence-gathering statement across these two groups was non-significant: Mean live = 33.82 (SD = 14.84); Mean video = 38.94 (SD = 14.17), $t(174) = 1.78$, $p = .08$. Nevertheless, we ran our primary analyses on both the full sample and the live-only sample to ensure this variable did not affect the findings.

³ Two versions of the event differed slightly in terms of names used (Alex/Adam, Max/Mark), objects shown (abacus/slate), and prop ‘stolen’ (keys/phone). No differences emerged in the number of correct details recalled in the brief evidence gathering statement across these two versions for the

reasons this was a mild minor crime event. Immediately after the event, the children were questioned individually about what they saw, in a brief evidence gathering statement that began with the open question: “Tell me what you remember about what you just saw” and was followed (if necessary) by prompts asking about who was there, what the people looked like, when it happened and where it happened (see Henry et al., 2017a, for further information).

Phase 2 – Investigative Interviews. Approximately one week later, children took part in one of four types of investigative interview.

Best-Practice. Based on Achieving Best Evidence principles (Ministry of Justice, 2011), this interview comprised seven key phases: (1) greet and personalise the interview; (2) rapport building (chatting to the child about areas of interest); (3) truth and lies exercise (e.g., determining whether the child correctly responds to a statement along the lines of ‘that lady is wearing a blue jumper’ when it is red); (4) explain the purpose of the interview; (5) free recall (recall attempt 1 – ‘Tell me everything you can remember about what you saw’); (6) questioning (recall attempt 2 – using open questions based upon what the child had already recalled); and (7) closure.

Registered Intermediary (RI). Here, children were supported by one of two experienced, practising RIs. Prior to the interview, the RI individually assessed each child and there was a meeting between the RI and each interviewer to discuss recommendations for the interview and to flag any individual needs. RIs advised the interviewers to follow the protocol for the Best-Practice interview, with some adaptations (e.g., simplifying the verbal instructions given to the children, and recommending the use of visual aids that were provided by the RIs). At all times, the RI was present to facilitate communication between

current sample: Mean Version A (n=87) = 34.03 (SD = 12.94); Mean Version B (n=89) = 35.45 (SD = 16.49), $t(174) = .63$, $p = .53$. Nevertheless, we controlled for this variable in our primary analyses.

the child and the interviewer. As the interviewer proceeded through the Best-Practice interview protocol, the RI intervened when appropriate to facilitate effective communication (verbally or by suggesting the use of suitable props).

Verbal Labels. This followed the procedure for the Best-Practice interview except that, following phase 5 (free recall), witnesses received ‘tell me more’ prompts in relation to four key areas (adapted from Brown & Pipe, 2003): (1) the people in the event; (2) the setting where the event took place; (3) the objects that were involved and what happened with them (actions); and (4) what the people said.

Sketch-Reinstatement of Context (Sketch-RC). This followed the procedure of the Best-Practice interview except that, prior to phase 5 (free recall), witnesses were instructed to think about the event and draw whatever reminded them about it, as well as what happened. Witnesses were asked to explain to the interviewer what they were drawing. After finishing their sketch, children were asked to give a free recall account of what happened (as per the Best-Practice interview) and were told they could use their drawing to point out or explain things (Dando, Wilcock, & Milne, 2009).

Phase 3 - Cross-examination. Prior to the cross-examination, children were ‘refreshed’ on their evidence as per Achieving Best Evidence guidance (Ministry of Justice, 2011) and the Registered Intermediary Procedural Guidance Manual (Ministry of Justice, 2015). This is standard practice for witnesses in advance of cross-examination within courts in England and Wales. Therefore, as in real-life, cross-examination performance may draw upon original memories of the event and recent memories of the refreshed interview. The researcher visited the child to explain that, in the next day or so, they would be speaking to a barrister who would ask them some questions about the staged event they previously saw.

The researcher explained that the child would be listening to the audio of their interview⁴, to remind them of the event and what they had said. After refreshing of the evidence, the researcher again reminded the child about the forthcoming cross-examination.

A team of six barristers was recruited for the cross-examinations, comprising four men and two women. Five were currently practising barristers, whilst one was no longer practising but had their own legal business. Barristers had between 5-21 years of criminal law experience (mean=15.2 years).

Cross-examination – a new methodological approach. For the cross-examination, a ‘defence statement’ was developed for each version of the staged event, which the barristers were asked to put to the children. This created a more realistic situation in which the barrister was representing a defendant in relation to a charge of theft. The defence statement (and the cross-examination protocol) was developed with the advice and guidance of an experienced barrister. The first two items in the statement included correct information designed to set the scene, establish rapport with the child witness, and make them feel at ease. The remaining points contained an element of untruthfulness (except for points 6 and 7, which were included so children did not feel that they were disagreeing with all the points the barrister was raising). Table 2 provides a sample defence statement for one version of the event.

[insert Table 2 about here]

Barristers were asked to challenge the child on all seven of the ‘false’ points (e.g., “*I think you’ve got a little bit mixed up because it wasn’t the phone that Adam put in his pocket, it was the keys, wasn’t it?*”) a maximum of four times (a decision, in consultation with one of the barristers, to avoid ethical concerns). As there was variability in this (based on barrister judgement), scores only reflect whether a child complied immediately, following challenge/s,

⁴ We did not have permission to video all children, although we did have permission to audio record all children, therefore, audio recordings were used to refresh children on their evidence.

or not at all. If the child complied with the challenge on first time of asking, they received a resistance score of 0; if they complied with a challenge on the second or subsequent time of asking, they received a resistance score of 1; and if they did not comply at all, they received a maximum resistance score of 2. Average resistance scores on each of the seven false points could range from 0-2, with higher scores indicating higher cross-examination resilience (i.e., lower compliance with false statements). On a few occasions, barristers judged that it was not necessary to pose all challenges to the children. In real life, barristers make judgements about how much/little to press a witness and do not take a fixed approach, so the present study aimed to reflect this. Therefore, mean resistance scores were calculated for each child based on the total number of challenges given.

We were careful to code the child's original recall of information pertaining to each of the seven false points (taken from the investigative interview), so this score could be controlled in the analyses. These 'memory trace' scores were allocated for full (3), moderate (2), partial (1) or no (0) knowledge about six of the false points in terms of degree of information recalled in the investigative interview. For one other point (false point 5), this was a complete confabulation about something that did not happen at all in the event, therefore, a score of 0 was allocated for all children because it was not possible to code this item in terms of original recall of information (Maximum memory trace score=18: see Table 1 for mean memory trace scores and Supporting Information for full details of the coding scheme). Fifteen percent of the transcripts were independently coded by a second rater for memory trace scores and intra-class correlations for information pertaining to each of the challenges ranged from .89 to 1.00, indicating excellent inter-rater reliability.

Cross-examination – the study protocol. One special measure available to support vulnerable witnesses in courts in England and Wales is the 'live link'. The child is not present in the courtroom with the barristers, judge or jury, but is in a separate room. Those in the

courtroom see the child via a television screen, and the child can see the judge or barrister on his/her screen. To mimic this, cross-examinations were performed using video conferencing software (Skype). A female researcher was in a room with the child at their school and partially took on the role of 'judge'. We could not entirely replicate the judge role as we had no facility for the child to view the judge only via the screen - and for ethical reasons the researcher had to be with the child - so this aspect of the study must be viewed as approximate to real-life. There was a brief 'ground rules hearing' between the judge and the barrister prior to each individual cross-examination (with or without an RI) where the judge explained any important considerations to the barrister (e.g., age of child, any additional needs they had). As a prelude to the cross-examination, the judge explained to the child that they: (1) needed to tell the truth – must not guess or make anything up; (2) could say that they 'don't know' or 'cannot remember'; (3) should say if they do not understand something the barrister says; (4) could tell the barrister if they get something wrong; and (5) should say if there is a problem of any kind (as per the Judicial College Bench Checklist: Young Witness Cases, 2012). The judge also described the role of the barrister, explaining that they would be asking the child questions about what happened during the staged event. The judge added that the job of the barrister was to test the evidence, so they may ask questions that challenge what the child has said, but all the child needed to do was tell the truth about what they could remember or say if they did not know the answer. Whilst judges are advised to explain how often breaks are planned, and to inform the child that the judge can always see them via live link (even if they cannot see the judge), these elements were not incorporated in the instructions as: (a) the cross-examinations were short, and breaks would not be needed; (b) the judge was already in the room with the child.

Once the child and barrister were introduced, they listened to the child's audio of their investigative interview together, so everyone could hear it (barristers were provided with a

transcript of the children's testimony, as well as basic demographic information, in advance of the cross-examination, to enable them to prepare their questions; in real-life, they would have access to the child's evidence-in-chief in advance of the refreshing of the evidence).

The barrister then began questioning the child, with the only stipulations being that they were to cover all points on the defence statement (unless the child appeared to show any signs of distress), and that – for ethical reasons – they were not to excessively challenge the child on their testimony (no more than four challenges per point).

At three time points (before, during and after the cross-examination), children were presented with a ten-point visual analogue rating scale. This enabled us to monitor how worried or anxious the children were (1 = no anxiety; 10 = high anxiety) and to offer additional support or reassurance if their responses highlighted that they were affected by the cross-examinations. Note that these anxiety ratings were not study variables but introduced for ethical reasons. Most children were not highly anxious at any point. Before the cross-examination, 7 children (4%) had scores at the top end of the anxiety scale (8, 9, 10); during the cross-examination this figure was 9 children (5%); after the cross-examination nearly all (171 children, 97%) had the lowest anxiety scores of 1, 2, or 3 (and the remaining 5 children had moderate scores of 4, 5 or 6). Cross-examinations were, on average, 8.56 minutes long (SD = 2.24 minutes, range 3.53 minutes to 16.25 minutes).

Cross-examination protocol – the RI condition. The protocol for the cross-examinations was the same across three interview conditions (Best-Practice, Sketch-RC and Verbal Labels), but there were some differences for the RI condition. As per recommendations for best practice in England and Wales at the time of the study (Registered Intermediary Procedural Guidance Manual, Ministry of Justice, 2015), children received RI assistance both at their initial interview and again at cross-examination. Of the 33 children in the RI condition, 18 were assisted by the same RI at both stages, which is also recommended

best practice, and 15 had a different RI at cross-examination (although using exactly the same protocol). In real cases there is also likely to be some variability in whether the same RI is available for both stages. RI assistance involved the following: Prior to the cross-examination, all children were re-assessed by the RI to ensure that information about the child's communication needs (originally collected 8-13 months previously) was up-to-date and accurate. This re-assessment took place at least a week before the cross-examination and consisted of: (1) re-establishing rapport with the children; (2) explaining what would happen in the cross-examination; (3) checking the children could say they 'don't know' or 'cannot remember', and could state whether the barrister (adult) was wrong or right; (4) checking the children could respond to questions beginning with, for example, 'when' or 'how'; and (5) preparing simplified instructions for the judge to present during the preamble before the cross-examination (to make them easier to follow and remember). The barristers and RIs also met together for a dedicated 'ground rules hearing' (see Cooper, Backen & Marchant, 2015, for further details) prior to all RI cross-examinations, in which the RIs explained what their role was and discussed their recommendations with the barristers. In real-life, ground rules hearings would take place for each individual child. However, the RIs noted that many of their recommendations would be the same for most children in the study, so one overall ground rules hearing was conducted (with RIs flagging individual cases where necessary). [Note that this was in addition to the 'short' ground rules hearing for each individual child just before the cross-examination (regardless of interview condition).]

At the ground rules hearing, RIs discussed the principles of questioning and gave barristers a written summary of their suggestions. The summary included advice to: practice the live link prior to the child coming into room; use a short and simple preamble; be careful about references to do with time (e.g., when, how long), or questions requiring a number in the answer (e.g., how many); use a slow pace; allow thinking time; use short sentences with

only one point per question; use basic vocabulary and sentence structure; and use names the child knows people by. Question types were discussed and RIs recommended avoiding questions that: were negatively phrased; were statements with a questioning intonation; were tagged (e.g., ‘Max forgot his coat, *didn’t he?*’); had an answer implied; and were repeats of already asked questions. The RIs additionally: reviewed each barrister’s list of cross-examination questions and highlighted the specific needs of individual children prior to cross-examination sessions (discussions by phone or email); reminded barristers that visual materials were available if needed to support expressive language (drawing materials, small world figures/furniture) and sequencing of events (post-it notes, timelines); and brought along calming objects so they were available to the children if necessary. Importantly, RIs did not intervene about the content of the questions but rather the format (Ministry of Justice, 2015), for example “[Barrister’s name], could that question be rephrased, as you know it’s a tagged question” or if they thought the child would not understand the question, for example, “I am not sure [child’s name] will understand that complex question”. In the RI condition, an RI was present alongside each child for every cross-examination, simplified the instructions given to the children by the judge, and made interventions during the cross-examinations as required. For example, if the barrister moved away from planned questions or began to use statements with tags, the RI would remind the barrister of best practice. The RI also intervened if the child appeared not to understand or follow the questioning.

Coding child responses and barrister questions. Children’s responses were coded into mutually exclusive categories reflecting whether they complied, resisted, did not respond, responded with an open question, or sought clarification (see Table 3). When a child responded with an acknowledgement (e.g., ‘okay’), this was not coded as a response to the question. If the child said they were not sure, this did not mean they had complied:

children were instructed to say ‘don’t know’ if this was the case, so they were resisting the barrister’s attempts to get them to agree with them.

[insert Table 3 about here]

Barrister questions were coded into one of seven overarching mutually exclusive primary categories (see Table 4 for details). All questions (as well as non-content-based utterances which were given the code ‘other’) were coded separately, even if they occurred, sequentially, e.g. “*That’s really helpful, thank you very much* (code=other). *Okay, now they talked to you about Victorian schools* (code=assertion, true). *Did they tell you lots of things about what happened in Victorian times?* (code=invitation closed, true)” would attract three codes as indicated. Barrister questions were additionally coded for each instance of 17 other secondary features (see Table 5), which were not mutually exclusive categories, i.e., a question could challenge credibility as well as contain a tag. The coding systems were developed by looking at guidance on questioning available at the time (May 2015) in The Advocate’s Gateway (Toolkit 6, 2015), the Judicial College Bench Checklist: Young Witness Cases (2012), and the Equal Treatment Bench Book (Judicial College, 2013). We also used an iterative process of discussion and reflection on the coding process to capture all question types in one overarching primary code, yet additionally reflect other relevant question features within the secondary codes. The classification system was designed to be as comprehensive and informative as possible, although it could not capture more subtle features such as intonation.

Reliability of coding. To establish coder agreement, 10% of scripts were coded independently by a second coder. Overall percentage agreement was 91% (range 86-100%) for the child codes, 89% (range 82-92%) for the barrister primary codes and 88% (range 81-100%) for the barrister secondary codes, all of which represented moderately high agreement.

[insert Tables 4 and 5 about here]

Control measures. Around the time that the children took part in Phases 1 and 2 of the study, several cognitive measures (intelligence, language, memory, attention) were administered to ensure factors that may affect eyewitness recall and cross-examination were controlled or matched between interview groups (see Table 1 for differences between conditions that were controlled for statistically). **Intelligence.** Two subtests (Vocabulary and Matrix Reasoning) of the second edition of the Wechsler Abbreviated Scale of Intelligence (WASI-II; Wechsler & Zhou, 2011) were used to provide an assessment of intellectual ability and to establish suitability for entry into the study. **Language.** The British Picture Vocabulary Scale Third Edition (BPVS-3; Dunn, Dunn, & Styles, 2009) was used to provide a measure of receptive vocabulary. Two subtests (Sequencing, and Grammar and Syntax) of the Expressive Language Test 2 (ELT-2, Bowers, Huisinigh, LoGiudice, & Orman, 2010) assessed narrative ability and grammatical morphology, respectively. Two subtests (Recalling Sentences and Formulated Sentences) of the Clinical Evaluation of Language Fundamentals, 4th edition (CELF-4 UK; Semel, Wiig, & Secord, 2006) provided an assessment of the ability to recall and formulate grammatically correct, meaningful sentences. **Memory.** Subtests from the Test of Memory and Learning 2 (TOMAL-2; Reynolds & Voress, 2007) were used to provide a composite memory measure, comprising both verbal ('Memory for Stories' and 'Paired Recall') and non-verbal ('Facial Memory' and 'Visual Sequential Memory') memory. **Attention.** The Test of Everyday Attention for Children (Tea-Ch; Manly, Robertson, Anderson, & Nimmo-Smith, 1999) was used to assess a range of relevant attention skills: selective/focused attention (the 'Sky Search' subtest); sustained attention (the 'Score!' subtest); and sustained-divided attention (the 'Sky Search Dual Task' subtest).

General procedure

Ethical approval was obtained from the relevant university Research Ethics Committee. Prior to participation, written consent was obtained from parents, and children

also gave their own written assent to participate. At the start of Phase 1, children viewed the staged event and immediately took part in the Brief Interviews (see Henry et al., 2017a). Phase 2, Investigative Interviews (see Henry et al., 2017b) and Identification Lineups (see Wilcock et al., 2018), took place around one week later. Cognitive testing also took place around this time, which was split over several sessions to fit in with school timetables and to ensure children remained engaged with tasks. Phase 3, the cross-examinations, took place 8-13 months (Mean = 11.06 months, SD 1.69 months) after viewing the staged event. As some variability in this delay emerged across conditions (see Table 1) due to timing of school holidays and availability of RIs/barristers, we controlled for delay in the primary statistical analyses. All children were refreshed on their evidence in one session with the researcher, before the researcher returned at least one day later to conduct the cross-examination with the barrister. Children in the RI condition were re-assessed in a session prior to the refreshing of their evidence (on a different, earlier day). The RI was always present at the cross-examination and, beforehand, used a visual aid to explain to the child that they should only say what really happened, that if the barrister got something wrong, they could tell them, and equally that it was OK to say that the barrister 'got it right'. In addition, the children were told, using the visual aid, that it was OK to say 'I don't know', 'I can't remember', or 'I don't understand'.

Results

The key outcome measures for the primary research questions concerned: (1) children's cross-examination resistance scores on seven cross-examination challenges pertaining to false elements from the defence statement; and (2) whether RI assistance during cross-examinations reduced children's compliance with these challenges on false information.

Table 6 shows mean resistance scores (SDs). Ten children resisted all seven challenges on false information that the barrister put to them (5.7%), meaning that 94.3% of children complied with at least one challenge. Five children complied with all seven challenges on false information (2.8%).

[insert Table 6 about here]

Hierarchical multiple regression was used to examine whether cross-examination resistance scores on the seven false information challenges differed between children in the RI condition versus other conditions (note that we had no reason to expect cross-examination differences for the Sketch-RC and Verbal Labels conditions as they involved adaptations to investigative interview protocols). At step 1, three background variables showing differences between interview conditions (see Table 1 for details), namely age at cross-examination, IQ, and Verbal Memory, were controlled (BPVS scores also differed between interview conditions, but IQ and BPVS scores were highly correlated, $r=.66$, so only IQ was controlled). Three additional control variables included: memory trace scores (concerning relevant information pertaining to the false information challenges) as children in the RI condition had higher memory trace scores (they had benefitted from RI intervention at the investigative interview stage) (Henry et al., 2017b); event version (A or B); and length of delay before cross-examination (this differed across condition – see Table 1). At step 2, three dummy-coded interview condition variables were included to test for differences between conditions in cross-examination resistance. Best-Practice was the reference (control) group to which the other three conditions were compared: RI, Sketch-RC and Verbal Labels. The dependent variable was average cross-examination resistance score (see Table 6). With nine predictor variables in total, Green (1991) would recommend a sample size of at least 122, thus for the current regression our sample size exceeded the minimum numbers recommended. Key statistical checks (multicollinearity, Durbin-Watson, tolerance and VIF

statistics, Cook's and Mahalanobis distances, standardised DFbetas, leverage values, plots of standardised residuals and predicted standardised values, standardised residuals, partial plots) were within acceptable limits (Field, 2013).

Table 7 gives details of the regression. The full regression model was significant, $F(9, 166) = 5.37, p < .001$, accounting for 22.5% (18.3% adjusted) of the variance in cross-examination resistance scores. Step 1 was significant (R^2 change = 7.7%; $F(6, 169) = 2.35, p = .03$), indicating that the six control variables accounted for a small proportion of the variance when entered on their own (although only memory trace was significant when inspecting standardised Beta values, $Beta = .16, p = .04$). Crucially, Step 2 was also significant (R^2 change = 14.8%; $F(3, 166) = 10.61, p < .001$), indicating interview condition differences in cross-examination resistance. Inspection of the standardised Beta-values at Step 2 showed that only the contrast between the RI and Best-Practice interview conditions was significant ($Beta = .47, p < .001$). As tentatively predicted, children in the RI condition were less compliant with cross-examination challenges than children in the Best-Practice condition, with higher resistance scores (an average of .63 out of 2 higher with a 95% CI of .37-.88), once all other variables had been accounted for. All other variables were non-significant predictors at Step 2. To check whether initial viewing of the event live or via video affected the findings, this regression was repeated with only children who had seen the event live ($n=144$). The results were identical in all respects, except that memory trace score at Step 1 just missed significance ($p = .055$)⁵.

[insert Table 7 about here]

Children's responses

⁵ Results were similar when barrister was included as a further control variable – the only significant predictor at Step 2 was the contrast between the RI and Best-Practice interview conditions ($p < .001$). At Step 1 memory trace ($p = .03$) and barrister ($p = .01$) were significant predictors. However, this analysis is only exploratory because not all barristers were evenly spread across conditions.

The first subsidiary research question had two components: first, whether the numbers of compliant responses by children to barrister challenges on false information would be lower in RI interviews; and second, whether the numbers of resistant responses by children to barrister challenges on false information would be higher in RI interviews. Whilst children gave, on average, 46.40 (SD = 14.31) responses across the cross-examination, this differed across interview conditions, $F(3, 172) = 3.10, p = .03$, partial $\eta^2 = .05$. Bonferroni corrected paired comparisons indicated that children gave significantly more responses in the RI condition (mean = 52.82, SD = 13.05) than in the Best-Practice condition (mean = 43.82, SD = 11.40) ($p = .02$), but no other comparisons were significant. Given this, subsequent analyses were carried out on proportional scores (proportions of each type of response in relation to total number of responses for each child). Table 6 includes mean proportions of the seven types of responses.

Proportional data were not all normally distributed, so Kruskal-Wallis tests were used to explore whether there were differences between interview conditions for each type of response, with a Bonferroni adjusted significance level of $p < .007$ (for seven tests). Bonferroni corrected follow-up paired comparisons were used to explore any differences between interview conditions. Values of η^2 represent large ($>.14$), medium (.06-.14) or small (.01-.06) effect sizes.

Two analyses were of relevance to predictions as follows. For Complies (with false information) responses, a significant interview condition effect was present, $H(3) = 34.04, p < .001, \eta^2 = .18$. Follow-up comparisons indicated that, as predicted, proportions of Complies (false) responses were lower in the RI condition than in all other conditions: Best-Practice ($z = 5.39, p < .001$); Verbal Labels ($z = 4.94, p < .001$); and Sketch-RC ($z = 4.22, p < .001$). For Resists (false information) responses, no significant interview condition effect was present, contrary to predictions, $H(3) = 3.09, p = .38, \eta^2 = .00$.

We did not have specific predictions for the other five question types, but we present these analyses here, for completeness. For Complies (with true information) responses, a significant interview condition effect was present, $H(3) = 18.33, p < .001, \eta^2 = .09$: proportions of Complies (true) responses were lower in the RI condition than in other conditions: Best-Practice ($z = 4.02, p < .001$); Verbal Labels ($z = 3.54, p = .002$); and Sketch-RC ($z = 3.05, p = .014$). For Open responses, a significant interview condition effect was present, $H(3) = 21.96, p < .001, \eta^2 = .11$: proportions of Open responses were higher in the RI condition than in other conditions: Best-Practice ($z = -3.48, p = .003$); Verbal Labels ($z = -4.48, p < .001$); and Sketch-RC ($z = -3.51, p = .003$). No other interview condition effects reached significance for child responses: Resists (true information), $H(3) = 10.65, p = .014, \eta^2 = .04$; No Response, $H(3) = 5.86, p = .12, \eta^2 = .02$; and Seeks Clarification, $H(3) = 4.44, p = .22, \eta^2 = .01$.

Barrister questions

A second subsidiary research question concerned whether, in the RI condition, the barristers' questions might be more consistent with best practice guidance for cross examination or re-examination. Table 8 shows mean numbers of questions per cross-examination, as well as proportions of each of the seven primary overarching types of questions for each interview condition. Overall, barristers asked an average of 61.39 (SD = 18.78) questions per child. A one-way analysis of variance (data were normally distributed) showed a significant effect of interview condition, $F(3, 172) = 3.89, p = .01$, partial $\eta^2 = .06$. Bonferroni corrected paired comparisons indicated that barristers asked significantly more questions in the RI condition (mean = 71.09, SD = 17.87) than in the Best-Practice (mean = 58.92, SD = 16.75) ($p = .01$) and Sketch-RC conditions (mean = 58.26, SD = 16.43) ($p = .02$). [This is consistent with real cross examinations: to simplify questions, asking two questions rather than one is often necessary.] The RI and Verbal Labels (mean = 60.35, SD = 22.42) conditions did not differ significantly ($p = .08$). Given these differences, further analyses on

barrister questions were performed using proportional scores: the total number of questions in each question-type category were divided by the total number of barrister questions asked per child. These proportional data were not all normally distributed, so Kruskal-Wallis tests were used to explore whether there were interview condition differences on each question type, with a Bonferroni adjusted significance level of $p < .007$ (for seven tests). Bonferroni corrected follow-up paired comparisons were used to explore any differences between interview conditions.

Invitation Open questions differed significantly across interview condition, $H(3) = 45.24, p < .001, \eta^2 = .25$. Proportions of Invitation Open questions were higher in the RI condition than in other conditions: Best-Practice ($z = -5.63, p < .001$); Verbal Labels ($z = -6.18, p < .001$); and Sketch-RC ($z = -5.03, p < .001$).

Invitation Closed (true information) questions differed significantly across interview condition, $H(3) = 39.91, p < .001, \eta^2 = .22$. Proportions of Invitation Closed (true) questions were higher in the RI condition than in other conditions: Best-Practice ($z = -3.80, p = .002$); Verbal Labels ($z = -5.91, p < .001$); and Sketch-RC ($z = -5.00, p < .001$). A difference between Verbal Labels and Best-Practice also emerged ($z = 2.87, p = .02$).

Assertion (true information) questions differed significantly across interview condition, $H(3) = 48.78, p < .001, \eta^2 = .27$. Proportions of Assertion (true) questions were lower in the RI condition than in any other condition: Best-Practice ($z = 5.41, p < .001$); Verbal Labels ($z = 6.49, p < .001$); and Sketch-RC ($z = 5.51, p < .001$).

Assertion (false information) questions differed significantly across interview condition, $H(3) = 16.71, p < .001, \eta^2 = .08$. Proportions of Assertion (false) questions were lower in the RI condition than in the Verbal Labels condition ($z = 3.64, p = .001$) and the Sketch-RC condition ($z = 2.81, p = .03$); and that they were higher in the Verbal Labels condition than in the Best-Practice condition ($z = -2.80, p = .03$).

Option-posing questions differed significantly across interview condition, $H(3) = 11.49, p=.009, \eta^2=.05$. Proportions of option-posing questions were lower in RI than in Best-Practice interviews ($z=2.65, p=.049$). No other paired comparisons were significant.

Invitation Closed (false information) questions ($p=.10$) and Other questions ($p=.03$) showed no significant interview condition differences.

[insert Table 8 about here]

Table 9 includes breakdowns of barrister questions into 17 secondary features. These are presented as proportions (i.e. divided by the total number of barrister questions), but will not add up to one given the categories are not mutually exclusive (any question could be classified in one or more ways). [Note: no instances of the barrister saying the child was ‘lying’ were found; similarly, mean proportions for use of idiom were less than 1%; so these data were excluded.] These proportional data were not all normally distributed, so Kruskal-Wallis tests were used to explore interview condition differences for each question feature, with a Bonferroni adjusted significance level of $p<.003$ (for 15 tests). Bonferroni corrected follow-up paired comparisons were used to explore any differences between interview conditions.

Eight secondary question features showed significant interview condition differences.

Tags, $H(3) = 53.71, p<.001, \eta^2=.29$. Proportions of Tags were lower in the RI condition than in any other condition: Best-Practice ($z=5.58, p<.001$); Verbal Labels ($z=6.54, p<.001$); and Sketch-RC ($z=6.23, p=.008$).

Credibility, $H(3) = 30.74, p<.001, \eta^2=.16$. Proportions of Credibility challenges were lower in the RI condition than in other conditions: Best-Practice ($z=5.46, p<.001$); Verbal Labels ($z=3.92, p=.001$); and Sketch-RC ($z=3.03, p=.01$).

Repetition, $H(3) = 22.54, p < .001, \eta^2 = .11$. Proportions of Repeated questions were higher in the RI condition than in the Best-Practice ($z = -4.65, p < .001$) and Verbal Labels ($z = -3.17, p = .009$) conditions.

Social Influence of another person, $H(3) = 28.64, p < .001, \eta^2 = .15$. Proportional use of Social Influence was higher in the RI condition than in other conditions: Best-Practice ($z = -5.28, p < .001$); Verbal Labels ($z = -3.95, p < .001$); and Sketch-RC ($z = -3.67, p = .001$).

Possibility, $H(3) = 22.30, p < .001, \eta^2 = .11$. Proportional use of Possibility was lower in the RI condition than in other conditions: Best-Practice ($z = 4.71, p < .001$); Verbal Labels ($z = 3.03, p = .014$); and Sketch-RC ($z = 2.97, p = .018$).

Praise, $H(3) = 26.92, p < .001, \eta^2 = .14$. Proportions of Praise were lower in the RI condition than in other conditions: Best-Practice ($z = 4.86, p < .001$); Verbal Labels ($z = 4.37, p < .001$); and Sketch-RC ($z = 3.43, p = .004$).

Filler questions, $H(3) = 22.90, p < .001, \eta^2 = .12$. Proportions of Filler questions were higher in the RI condition than in the Best-Practice ($z = -4.61, p < .001$) and Verbal Labels ($z = -3.67, p = .001$) conditions.

Reassurance, $H(3) = 24.63, p < .001, \eta^2 = .13$. Proportions of Reassurance were lower in the RI condition than in other conditions: Best-practice ($z = 4.95, p < .001$); Verbal Labels ($z = 3.15, p = .01$); and Sketch-RC ($z = 2.73, p = .038$).

[insert Table 9 about here]

Discussion

In this paper, a novel experimental methodology for the cross-examination of vulnerable child witnesses has been presented. Experienced barristers questioned children based on a 'defence statement' containing seven false elements, without recourse to a 'script' (as is typically used in experimental research on cross-examination). As predicted, children complied with barristers' challenges on this false information to a high degree: 94% of

children complied with at least one cross-examination challenge on false information, consistent with previous experimental studies using scripted questioning in which compliance rates ranged between 70% and 98% (cf. Bettenay et al., 2014; Righarts et al., 2015; Zajac & Hayne, 2003, 2006; Zajac et al., 2009). Our findings underline concerns about whether cross-examination is a reliable method for obtaining best evidence from child witnesses, given that lawyers try to ‘persuade children to change details in their accounts, often by exploiting their developmental limitations’ (Andrews & Lamb, 2016, p. 953).

We also tested, in an exploratory way, whether RI assistance, available in England and Wales, might help children to give better evidence by reducing compliance with barristers’ cross-examination challenges on false information. As per recommendations for best practice in England and Wales at the time of the study (Ministry of Justice, 2015, see also current Registered Intermediary Procedural Guidance Manual, Ministry of Justice, 2020b), children received RI assistance at their initial interview and again at cross-examination. As tentatively predicted, RI assistance at cross-examination reduced children’s compliance with false information, even after controlling for background cognitive factors, other key factors that could have influenced the findings, and memory for relevant details of the original event. Specifically, when children were challenged to agree with evidence that was ‘false’ (i.e., the barrister was suggesting that the child should agree with something in the defence statement that was ‘false’ and the child needed to resist this line of questioning), RI assistance made it less likely that children would comply with the barrister’s challenges. This finding highlights the importance of using RIs for typically developing children to ensure that they do not give compliant responses to false information or change their responses when pressurised. For a child to accept that it was "possible", for example, that a woman had helped set up the video camera (when no such woman was present), would be enough to be used by the defence lawyer in undermining the evidence given the burden and standard of

proof in criminal trials⁶. Overall, these exploratory findings about RIs support current recommendations in the Equal Treatment Bench Book (Judicial College, 2018; 2020) that: “All young witnesses should ideally have an intermediary assessment as, no matter how advanced they appear, their language comprehension is likely to be less than that of an adult witness” (paragraph 98, page 60). For typical children, RIs also help improve volume of recall in interviews and accuracy of identification in video lineups (Henry et al., 2017b; Plotnikoff & Woolfson, 2012; Wilcock et al., 2018). Overall, therefore, providing RIs for primary age typical children may improve the quality of their evidence.

A subsidiary research question concerned whether, when we broke down children’s specific responses to barrister questioning, these responses would be less compliant with *and* more resistant to challenges on false information in the RI condition. As tentatively predicted, significantly lower proportions of ‘complies with false information’ responses were given by children in the RI condition than in other conditions (5% in the RI condition versus 11%-13% in other conditions): children were less likely to agree with a barrister’s false statement in the RI condition. Although the proportions of ‘resists false information’ responses did not vary with interview condition, as expected, this could be because resisting a false statement is more difficult for a child (i.e., actively saying ‘that is not true’) than not agreeing with a false statement (possible with more passive responses such as ‘don’t know’ or providing no response at all). Overall, these findings accorded closely with the primary research finding that RI assistance helped children to reduce compliance in response to barrister challenges on false information.

A final subsidiary research question concerned whether barristers would ask questions more aligned with best practice recommendations in the RI condition. In support of this,

⁶ Although our study specifically looked at compliant responses to ‘false information’, which are undesirable, in some cases such responses would be appropriate if the information were true.

barristers asked proportionally more Invitation Open questions in the RI condition. Whilst these have been associated with inconsistencies (due to the longer answers they elicit) (Pichler et al., 2020), they are consistent with best practice (Ministry of Justice, 2011), are least likely to lead the witness (Henderson et al., 2019), and are highly valued by practitioners (Magnusson, Ernberg, Landström, & Akehurst, 2020). Invitation Open questions were, nevertheless, relatively rare, as reported in real cases (e.g., Andrews & Lamb, 2016; Pichler et al., 2020; Zajac et al., 2018). Rates here ranged from 4-5% in non-RI conditions, to 12% in RI cross-examinations. Also consistent with best practice, barristers asked proportionally fewer Assertion questions in the RI condition. Such questions are risky because they present a strong statement that might be difficult to resist and could, thus, lead the witness (Henderson et al., 2019; Judicial College, 2013; The Council of the Inns of Court, 2019). Proportions of Assertions about true information were significantly lower (21%) in RI interviews than in other interviews (range 32%-36%), although proportions of Assertions about false information did not reveal such consistent group differences (RI =6%, other conditions =11%-16%).

Other findings concerning the barrister questions were harder to interpret. Invitation Closed (true information) questions were significantly higher in RI interviews (33%) than in other interviews (range 18-24%), although no group differences emerged for Invitation Closed (false information) questions. In real cases it may not be apparent whether these yes/no style questions are misleading, if the truth is not known. Yes/no questions for 'true' information may be less risky in terms of leading the witness, whereas yes/no questions for false information could be actively misleading. Finally, the small group difference in Option-Posing questions indicated somewhat fewer of these in the RI condition than the Best-Practice condition, but rates of these questions were low (3% or less in all conditions), so this result should be viewed with caution.

Further detailed classification of the features of barrister questions into secondary categories offered some evidence that they were more aligned with best practice recommendations in the RI condition. First, there were reductions in the use of suggestive tag questions (4% versus 19%-28%), supporting existing best practice guidance (Ministry of Justice, 2011; Judicial College, 2013, 2018; The Advocate's Gateway, 2015; The Council of the Inns of Court, 2019). Second, there were reductions in challenges to the children's credibility (2% versus 5%-7%) and fewer suggestions that something 'possibly' happened (<1% versus 3%-4%). Although these questions were infrequent overall, the lower rates in RI interviews may have increased the child's confidence in themselves as a respondent, particularly as children dislike having their credibility challenged (Plotnikoff & Woolfson, 2012).

More difficult to interpret was the fact that RI interviews showed increases in repetitions compared to most other interviews (12% versus 5%-9%). Question repetition is not recommended as it could confuse or exploit the child into changing answers (Andrews et al., 2015b; Ministry of Justice, 2011; Judicial College, 2013, 2018; The Council of the Inns of Court, 2019). In fact, the RIs removed any repeated questions when checking barrister questions before cross-examination, so it is possible that barristers re-introduced them to help children to follow the line of questioning if they lost track, or because they were unable to diverge from the listed questions if they wanted to press a point. Other differences in RI interviews that were unexpected included the use of 'social influence of another person' being more common (9% versus 3%-4%). This could reflect barristers switching from challenging the children's credibility outright or inferring the 'possibility' of being incorrect, to rely on a gentler approach by suggesting they were affected by social influence of another person instead. It could also reflect a technique to check the child's ability to challenge the barrister (or the defendant) who expresses a different view. There was also less praise and

reassurance (4% versus 8%-10%, and <1% versus 2%-4%, respectively) in RI cross-examinations, perhaps because barristers opted to give more praise and reassurance in non-RI interviews to conceal the fact that they were undermining the child's evidence. Finally, there were more irrelevant (filler) questions (although note that the RI vs S-RC comparison here was not significant and the values were low in all cases: RI 2% and other conditions 1% or less). Overall, despite some areas of uncertainty, these findings suggest that recommendations by RIs regarding the wording of cross-examination challenges could align questioning more closely with best practice recommendations.

The study findings may contribute to internationally available sources of guidance about how lawyers should question children in court, given concerns in this area (e.g., Andrews et al., 2015a). Further training about how to question vulnerable witnesses (e.g., advocates in England and Wales now attend training to acknowledge the '20 Principles of Questioning', The Council of the Inns of Court, 2019), along with pre-trial ground rules hearings as standard (see Henderson et al., 2019), would be useful for all barristers involved in child cases. The Advocate's Gateway provides detailed recommendations for barristers and other legal professionals on questioning a range of vulnerable witnesses, including children (www.theadvocatesgateway.org). Pre-trial guidance aimed at children may also help because practice sessions in responding to cross-examination style questions on an unrelated topic can significantly improve children's overall accuracy during a cross-examination interview (Irvine, Jack, & Zajac, 2016; Righarts, O'Neill, & Zajac, 2013), provided it is given close to the interview date (O'Neill & Zajac, 2013). Future research could investigate a combination of RI assistance and timely pre-trial preparation (perhaps delivered as part of the RI assessment), as combining these interventions may further improve the quality of children's cross-examination evidence.

One area the study was unable to illuminate was whether the RI assistance impacted on the child's responses, the barrister's questioning technique, or both. We are also uncertain about the mechanisms and exact points through which RI assistance operated, but it is important to note that the overarching role of the RI is to support the child's communication needs (e.g., simplifying instructions, using visual aids) and impact the barrister's questioning to ensure it is appropriate. All of this should help the witness more easily understand what others are saying so that they can communicate better. Further research could unpick the important mechanisms underpinning the interplay between children's responses and barristers' questions. The very nature of cross-examination requires some fluidity in questioning and a good advocate will always be influenced by the child's responses. The exception to this would be to use a rigid script of questions (which is necessary in some extreme cases, but not generally). Otherwise, the barrister will be flexible and adapt in response to the child's answers. This was one of the advantages to our novel approach to assessing cross-examination empirically, which has, to our knowledge, not been addressed in previous empirical work.

There are some limitations to the study that should be acknowledged. One is that the findings are applicable only to defence barristers, as different lines of questioning may be applied by prosecution barristers (Denne, Sullivan, Ernest, & Stolzenberg, 2020). Another is that children in the RI condition, as per best practice guidance (Ministry of Justice, 2015), had already received RI assistance during previous phases of the mock criminal investigation: this was given at the investigative interview stage (which also included an identification lineup). Therefore, the current conclusions can only be applied to children who have had RI assistance throughout a criminal investigation which, in practice, is not always the case (RIs may sometimes only be brought in at trial stage, although this is not recommended). A related issue was that children in the RI condition remembered more about the initial witnessed

event, as RI assistance was effective in increasing the volume of accurate recall at investigative interview (Henry et al., 2017b). This meant that children in the RI condition started their cross-examination with a recall advantage. We mitigated this by controlling for how well the child had recalled key facts about the false information in the defence statement (memory trace scores). Although memory trace was not a significant predictor of cross-examination resistance in the full regression (and many children did not score highly on this measure), future research could match on initial memory of the staged event before instigating cross-examinations in groups with and without RI assistance. This method would mean that no children could be included who had previously undergone an investigative interview assisted by an RI, but such a method would provide evidence about the effectiveness of RI assistance brought in only at the trial stage.

Further limitations are as follows. We used a mild minor crime event that took place in a familiar environment (the children's school), so were unable to replicate the anxiety, unfamiliarity and potential trauma of a real court case, which limits generalisation of the findings to real cases. Children were seen by friendly and supportive researchers, and the barristers were also approachable and experienced – they were, partly, chosen on the basis of having previous experience in cross-examining children (for ethical reasons) – again, this might not be so in real-life. Our ground rules hearings for non-RI children were also brief, and more recent guidance now recommends they are included as 'good practice' for all young witnesses (Judicial College, 2018, revisions 2020, Equal Treatment Bench Book, p.64). Finally, the length of the cross-examinations, for ethical reasons was short (average 8.56 minutes) compared to real cases (reported in England and Wales as between 45 minutes and 3 hours, Baverstock, 2016). However, Henderson et al. (2019) reported much shorter video-recorded cross-examinations (16 minutes) in a pilot trial of this special measure in England, and with new advocate training and guidance, cross-examinations are likely to be more

limited in length (e.g., Judicial College, 2018). Similarly, although studies of court transcripts in Scotland, California and New Zealand have emphasised the large numbers of questions (ranging from 160-500) posed to children by prosecutors and defence lawyers (Andrews & Lamb, 2016; Andrews et al., 2015a; Klemflus et al., 2014; Zajac & Cannan, 2009), the number of questions posed during pilot video-recorded cross- and direct-examinations in Henderson et al.'s (2019) study was lower (average=92). Thus, although the current cross-examinations contained fewer questions (average=61), the overall numbers of questions may be more aligned with the newer pre-recorded cross-examinations in England. Given that long and complex cross-examinations will likely lead to fatigue, worsening the quality of evidence (e.g., Zajac et al., 2018), changes that encourage shorter questioning should be advantageous.

Conclusion. The current study was the first to use a more ecologically valid defence statement as the basis for unscripted empirical cross-examinations. Using this novel method, we found that children complied with a very high number of barrister challenges on false information. However, we also found exploratory evidence that RI assistance reduced children's compliance with barristers' cross-examination challenges on false information. This could be, in part, because the barristers asked questions that were somewhat more aligned with best practice recommendations in the RI condition. These findings extend previous research on the utility of RIs during investigations (evidence-gathering interviews and identification lineups). They provide additional evidence of the importance of using RIs to ensure typically developing young children can give accurate testimony during the final investigative phase (cross-examination).

Table 2. Sample defence statement from one of the two versions of the event^a (including the ‘truth’ and the seven ‘false’ statements)

	<u>Points from the defence statement</u>	<u>The ‘ground truth’ – from the event</u>
1	One morning last year, Max and I visited a school to give a talk about the Victorians to the children and their teachers	True.
2	Max was wearing a blue top and has short brown hair. I was wearing a grey top and had long blond hair tied back in a ponytail.	True.
3	When we arrived, a woman helped us by setting up the video camera at the back which recorded the talk.	False item 1 – Adam set up the video camera. There was no woman involved in the event.
4	We told the children some rules that Victorian children had to obey, for instance, we said that boys must learn needlework	False item 2 – whilst the children were told about rules, this specific example is incorrect – the children were told that girls (not boys) had to learn needlework.
5	We showed the children a slate and Max showed them how to write the letters of the alphabet on it with chalk.	False item 3 – the children were shown a slate, but Max wrote a sum on the slate (not the alphabet).
6	Max is very forgetful and during the talk he asked the children to remind him not to forget his phone at the end of the talk.	True.

- | | | |
|----|--|--|
| 7 | Max then put his phone on the chair in the hall. | True. |
| 8 | Max says that I stole his phone by taking it and putting it in my pocket – I did not do this. Max’s phone was on the chair the whole time. I did not go near the chair at any time during or after the talk. | False item 4 – Adam did take Max’s phone and put it in his pocket. |
| 9 | I did borrow Max’s keys during the talk and put them in my pocket. | False item 5 – there were no keys involved in the staged event. |
| 10 | At the end of the talk, Max forgot his coat. | False item 6 – Max forgot his jumper (which he spoke about at the start of the talk). |
| 11 | When Max forgot his coat, I had to go back to get it. | False item 7 – Max (not Adam) returned after he had left, to collect the forgotten item. |

^a Whilst the other version of the event was very similar, points 4-11 on the defence statement differed: for example, there were slightly different names (Mark and Alex) for the key actors; children saw the theft of a set of keys, but the barrister had to put to them that it was, in fact, a phone; and the children were told that boys had to learn technical drawing (with the barristers suggesting to them that this was girls).

Table 3: Types of child responses during cross-examinations with explanations.

Type of response	Explanation
<i>Complies (true)</i>	When a child complies with what the barrister has said, in relation to a true (correct) statement.
<i>Complies (false)</i>	When a child complies with what the barrister has said, in relation to a false (incorrect) statement
<i>Resists (true)</i>	When a child has resisted what the barrister has said, in relation to a true (correct) statement
<i>Resists (false)</i>	When a child has resisted what the barrister has said, in relation to a false (incorrect) statement
<i>No Response</i>	The child has not given a response
<i>Open Response</i>	When a child has given a response to a barrister's open question (they can't comply or resist, as the child is given the opportunity to tell their version of events)
<i>Seeks Clarification</i>	The child seeks Clarification (e.g., "I don't know what you mean")

Table 4: The seven overarching primary codes for barrister questions during cross-examinations, with explanations and examples

Type of Question	Explanation	Example
<i>Invitation Open</i>	A question that invites the witness to offer their account and does not declare the answer (or have a correct answer)	“Who set up the video camera?”
<i>Invitation Closed (true)</i>	A question that invites a yes or no response, or asks for confirmation – includes true (correct) information	“Did Alex set up the video camera?”
<i>Invitation Closed (false)</i>	A question that invites a yes or no response, or asks for confirmation – includes false (incorrect) information	“Did Mark set up the video camera?”
<i>Assertion (true)</i>	Questions in the form of a statement, which is true (correct); or a statement of the child’s previous response	“Alex set up the video camera.”; “Towards the back, that’s really helpful.”
<i>Assertion (false)</i>	Questions in the form of a statement, which is false (incorrect)	“Alex didn’t set up the video camera?”
<i>Option Posing</i>	Questions in the form of two or more options (that may include the option to choose ‘something else’)	“Had he got his back to you, front, side, something else?” “Was it blond or brown

		hair?" "Is that a big room or a small room?"
<i>Other</i>	Utterances that were not content- based questions (e.g. signpost, credibility, praise, clarification and reassurance)	"Lovely, thank you so much B."; "Can I ask you some questions about that because that's really helpful?"; "He did, that's fantastic, well done A."

Table 5: Further secondary classifications of features of the barrister's questions during cross-examinations, with explanations and examples.

<i>Classification</i>	<i>Explanation</i>	<i>Example</i>
<i>Tag</i>	A question asking for confirmation, suggestive as it communicates the expected response	"Mark picked up the keys, <u>didn't he</u> ?"
<i>Credibility</i>	A question that challenges the integrity or credibility of the witness, or their memory	"You think they did. You say you think, did you actually see them do it or are you guessing?"
<i>Negatives</i>	A question containing a negative	"Didn't Mark pick up the keys, not Alex?"
<i>Repetition</i>	Repeating the same question, even if interspersed by others	"Did Alex take the keys?" A: "No". "Did Alex take the keys?"
<i>Confirmation</i>	The advocate confirms the answer the child has given, in a best practice way - a permissible and gentle way of checking evidence	"I want to make sure I understand what you said..." "so they showed you the slate but they didn't do any writing, is that what you're saying?"
<i>Clarification</i>	The advocate checks that the answer the child has given is what was intended	"You nodded, so is that a yes, brilliant, thank you very much."

<i>Social influence of another person</i>	The barrister suggests that ‘someone else’ told them that what the child has said happened didn’t really happen	“Alex told me he didn’t take the keys”
<i>Possibility</i>	A question that suggests that what the barrister is putting to them might be true (even if the witness is unsure) – possibility is introduced	“And was there maybe a lady helping out?”
<i>Complex</i>	A question that is linguistically complex, because of the large number of instructions contained in it, because of ambiguity or because it has conjunctions making it long-winded	“But I hope that if I ask you some questions, and I know you’ve, you’ve gone through what you said in your, um, your interview about it, uh, if I ask you some questions, we might be able to work out together, um, exactly what happened when those two people came to school, okay?”
<i>Idiom</i>	Phrase with a figurative or literal meaning	“now let’s go back to square one”
<i>Do you remember...?</i>	Questions asking the witness if they remember what they said on a previous occasion are particularly frowned upon	“do you remember any other adults in the room?” “can you remember that?”

<i>Lying</i>	Directly accuses the witness of lying	Note: an example is not given as there were no examples of accusing the child of lying in the current study.
<i>Signpost</i>	Explaining or signposting changes of subject (includes references to original evidence, e.g., “in your interview, you said that...”)	“Now we’re going to talk about the other man, the man with the long hair called Adam.”
<i>Praise</i>	Thanking or commending the child in an encouraging way	“That’s brilliant, thank you for that. I’ve only got one more thing to ask you...”
<i>Filler</i>	Irrelevant questions	“The men who came to your school, were they funny?”
<i>Name</i>	The advocate uses the child’s name	“That’s really helpful, you’ve got a very good memory here N.”
<i>Reassurance</i>	The advocate provides reassurance that the child is doing okay	“That’s okay, not to worry, so you can’t help me with who set it up if you don’t remember.”

Table 6. Resistance scores for children in each interview condition (highest average resistance score is 2, lowest is 0), total numbers of child responses, and proportional (prop.) scores for different types of responses for each interview condition. Mean proportions (SDs) are given on line 1, medians (ranges) on line 2.

Scores	Best-Practice (n = 65)	Verbal Labels (n = 40)	Sketch-RC (n = 38)	Registered Intermediary (n = 33)
Cross-examination	.85 (.49)	.80 (.41)	.94 (.56)	1.42 (.45)
resistance score (average over 7 'false' defence statement elements)	.71 (.00-2.00)	.86 (.00- 1.67)	.84 (.00-2.00)	1.43 (.43-2.00)
Total number of child responses across full cross-examination	43.82 (11.40) 42 (26-71)	45.35 (16.41) 42 (12-78)	46.37 (16.2) 41 (16-78)	52.82 (13.05) 56 (33-76)

Supporting Information – Memory trace coding

During the cross-examinations, the barristers challenged children in relation to several key points from Alex/Adam's defence statement (note that there is one defence statement for each of the two event adaptations – Mark/Alex's adaptation with the abacus and keys; and Max/Adam's adaptation with the slate and phone). We coded the children's memory trace for each false item in the defence statement according to their original memory of the event (i.e., what information they recalled during investigative interview). This was in order to see whether memory for the initial information impacted on how resilient children were to cross-examination. The coding scheme below allocates scores for 'original' knowledge from the investigative interview about each false point that the barristers challenged the children on, i.e., scores of 0, 1, 2 or 3, according to the strength of their original memory trace from the investigative interview.

MARK/ALEX ADAPTATION

Note that the 'truth' is in italics.

1. One morning last year, Mark and I visited a school to give a talk about the Victorians to the children and their teachers. *{Scene setting question - true}*
2. Mark was wearing a blue top and has short brown hair. I was wearing a grey top and had long blond hair tied back in a ponytail. *{Scene setting question - true}*
3. **When we arrived, a woman helped us by setting up the video camera at the back which recorded the talk. False item 1. *{The video camera at the back was set up by Alex, with no help from anyone else}***

0 = no mention of camera;

1 = minimum of one mention of camera

e.g. 1: "one {of the men} had a camera"

e.g. 2: “they were filming what they did. And they said that, um, they were filming for their boss to check if they were doing what they were doing right”

2 = mention of camera being set up or turned on at start of the event

e.g. 1: “they started off and they put the tape on”

e.g. 2: “they said that w-, they were going to record some of the children in school...they put the camera on”

3 = mention of who set up/turned on the camera (i.e., one of the men – Alex - who gave the talk)

e.g. 1: “he had...grey – a grey top on...and he was the one who started the camera s-start, the video camera”

e.g. 2: “the man who was like, um, he was like one of the ma-, the, the men who was, um, the one who was like setting up the camera and doing stuff with the camera”

- 4. We told the children some rules that Victorian children had to obey, for instance, I said that girls must learn technical drawing. False item 2. {They did tell the children three rules Victorian children had to obey, but this specific example is incorrect – they said boys must learn technical drawing}**

0 = no mention of rules

1 = mention of rules the children had to learn (could be a mention of one/both of the other two rules: stand up when an adult walks in/not put up hands unless told to), or the number of rules – but no mention of gender/activities

e.g. 1: “they explained the rules first and one, well three of the rules and one was to stand up straight when – When told, when asked by, by your teacher. And you – the second was you’re not allowed to put your hand up, um, and I think the third one was, um, always write with your right hand”

e.g. 2: "That their teachers were more strict than ours...um...and then...they couldn't put their hands up unless they were told to do something"

2 = mention of gender rule or technical drawing rule but not in combination

e.g. 1: "boys had to learn like all their times tables or something off by heart or was it girls, I'm not sure"

e.g. 2: "also you have to do, I think technical drawing"

3 = mention of boys learning technical drawing (or drawing related activity)

e.g. 1: "Because the first rule was, um, boys had to, um, draw"

e.g. 2: "Boys had to draw a drawing every day"

5. **We showed the children an abacus and Mark showed the children how to take some coloured beads off the rods for counting. False item 3. {They did show the children an abacus but Mark did not take the coloured beads off the rod – he slid them across the rods}**

0 = no mention of abacus

1 = mention of abacus but not of any activities with abacus (must be them having it)

e.g. 1: "talking to us about school in the Victorian times and they pulled out an abacus out the bag and they asked us what...3 + 1 was and then, um...they guessed it was 6 but then everyone shouted out it was 5" {note: no mention of sum on abacus, so only one point}

e.g. 2: "he pulled the abacus out of the bag and he was really talking and, um, he kept asking the other one to stop throwing the keys"

2 = mention that the abacus was used for counting/sliding beads across (must be them sliding the beads or counting)

e.g. 1: "They counted with it"

e.g. 2: "well, they had that little bead thing. And they had to slide them along"

3 = abacus used sum (must be them doing a sum, e.g., $2 + 3$, on the abacus)

e.g. 1: “then they were saying about the abacus and this is what they used for maths. So if they had two red ones and then they had three, three, um, of those – Then you add them together and they said that would equal five – But one, but one of them said it was, um, it was six!”

e.g. 2: “they had this little, um, chart. And they were showing us, um, showing us how it worked and, um, they, and Mark – wait, Alex was holding it and Mark, um, put three on the, three counters on the top. And slipped three counters and then two at, on the second row and they were teaching us how much, um, what it was like – To add sums”

6. Mark is very forgetful and during the talk he asked the children to remind him not to forget his keys at the end of the talk. *{True - Mark did this}*
7. Mark then put his keys on the chair at the back of the hall. *{True - Mark did this}*
8. **Mark says that I stole his keys by taking them and putting them in my pocket – I did not do this! Mark’s keys were on the chair the whole time. I did not go near the chair at any time during or after the talk. False item 4. *{Alex did take Mark’s keys and put them in his pocket; and Alex did take the keys from the chair}***

0 = no mention of keys/stealing

1 = mention of keys but not of them being taken

e.g. 1: “There was, um, keys. He put them on the chair. Then said don’t forget, um, don’t, don’t let me forget”

e.g. 2: “Can you remember any objects they had with them? Keys”

2 = mention of keys being taken, but no identification of perpetrator (i.e., that it was the Alex – the other man); or reference to an issue with keys, but not a specific declaration that a Alex took the keys

e.g. 1: “there was keys on the chair and then one took the keys”

e.g. 2: “he was putting it down on the chair and then, at the end, um, another guy thought it was his keys but, but he, uh, it was some other man’s keys”

3 = mention of Alex taking Mark’s keys

e.g. 1: “the one who was recording, um, took the keys”

e.g. 2: “the ponytailed one, he, um, was being funny and he, um, was pretending to, um, say, um, to the man – he took his keys and then he t-, went in his pocket and said, ‘No, these are my key,’ when there were actually his keys”

- 9. I did borrow Mark’s phone during the talk and put it in my pocket. False item 5. {There was no phone involved in the staged event – Alex took Mark’s keys}**

0 = as this item was a complete confabulation – i.e. did not take place in the original event – all children were allocated a score of zero as there was no specific information available in their prior memory of the event.

- 10. At the end of the talk, Mark forgot his coat. False item 6. {Mark forgot his jumper, not his coat}**

0 = no mention of Mark having a jumper or forgetting something

1 = mention of Mark’s jumper (e.g., tied around waist or that he put it on the floor)

e.g. 1: “he had like a cardigan or jumper tied round his waist”

2 = mention of forgetting something at the end

3 = mention of Mark forgetting his jumper at the end

11. When Mark forgot his coat, I had to go back to get it. False item 7. {*Mark went back to get it – not Alex*}

0 = no mention of anyone having to return

1 = mention of someone having to come back but not to collect anything

2 = mention of someone returning to get jumper

3 = mention of Mark returning to get his jumper

MAX/ADAM ADAPTATION

Note that the ‘truth’ is in italics.

1. One morning last year, Max and I visited a school to give a talk about the Victorians to the children and their teachers. *{Scene setting question - true}*
2. Max was wearing a blue top and has short brown hair. I was wearing a grey top and had long blond hair tied back in a ponytail. *{Scene setting question - true}*
3. **When we arrived, a woman helped us by setting up the video camera at the back which recorded the talk. False item 1. {*The video camera at the back was set up by Adam, with no help from anyone else*}**

0 = no mention of camera

1 = minimum of one mention of camera

e.g. 1: “one had a camera”

e.g. 2: “they were filming what they did. And they said that, um, they were filming for their boss to check if they were doing what they were doing right”

2 = mention of camera being set up at start of the event (e.g., they set up camera)

e.g. 1: "they started off and they put the tape on"

e.g. 2: "they said that w-, they were going to record some of the children in school...they put the camera on"

3 = mention of who set up/turned on the camera (i.e., one of the men – Adam - who gave the talk)

e.g. 1: "he had...grey – a grey top on...and he was the one who started the camera s-start, the video camera"

e.g. 2: "the man who was like, um, he was like one of the ma-, the, the men who was, um, the one who was like setting up the camera and doing stuff with the camera"

4. **We told the children some rules that Victorian children had to obey, for instance, I said that boys must learn needlework. False item 2. {They did tell the children three rules Victorian children had to obey, but this specific example is incorrect – they said girls must learn needlework}**

0 = no mention of rules

1 = mention of rules the children had to learn (could be a mention of one/both of the other two rules: stand up to answer questions/use their right hand at all times), or the number of rules – but no mention of gender/activities

e.g. 1: "they were telling us that all the chil-, in the school, all the children had to like wear – right with their right hands"

e.g. 2: "if you wanted to ask a question, you had to stand up very straight"

2 = mention of gender rule or needlework rule but not in combination

e.g. 1: "one of them is, was like, um, um, knit-, um, knitting"

e.g. 2: "There was something about girls but I can't remember what it was"

3 = mention of girls learning needlework

e.g. 1: “every girl had to sew”; “The girls have to know how to sew”

5. We showed the children a slate and Max showed them how to write the letters of the alphabet with chalk. **False item 3.** *{They did show the children a slate but they wrote a sum on the slate – not letters of the alphabet}*

0 = no mention of slate/writing (or reference to slate/writing but not Max and Adam having a slate or chalk)

e.g. 1: “they said that they, uh, they used to write with, um, with either chalk or a, uh, a pen but it had, it was like a, like a flint sort of thing and, um, yeah. And the older kids, uh, the younger kids used, uh, like chalkboards and the older kids used, uh, a type of like paper”

1 = mention of slate (must be them having it) but no mention of anything that was written

e.g. 1: “And they used to say, they used slates instead. (Draws.) So he has a slate. And his hand is also holding a chalk. The slate has a wooden edge”

e.g. 2: “they showed us they’re like little whiteboards, but they’re not whiteboards, they’re like chalk ones”

2 = mention of slate and them writing on the slate

e.g. 1: “So when they showed us a slate board, they took it out with the chalk and the slate pencil. What they writ on the slate with”

e.g. 2: “(Draws.) Um, this is what they, they, they showed us this board. That they used, that the Victorians used to write on with this, this, with, they didn’t write with chalk, they, they wrote with this like pen that didn’t work on it – it had like a point on it. And it didn’t really work and, um, they used, and then they changed it to chalk and the chalk, and the chalk u-, was better on the board than the pen”

3 = mention that the slate was used for writing a sum

e.g. 1: “they wrote their maths on this slate thing – and then, um...they said that $2 + 3$ equals 6, but then the one in the blue t-shirt made him do it again on the other side”

e.g. 2: “I remember at one point they had, they got this chalkboard out. And, um, when they did, um, they wrote a sum on it, which was $2 + 3$ and then on the other side he wrote, wrote, one of the men wrote 5”

6. Max is very forgetful and during the talk he asked the children to remind him not to forget his phone at the end of the talk. *{True - Max did this}*
7. Max then put his phone on the chair at the back of the hall. *{True - Mark did this}*
8. **Max says that I stole his phone by taking it and putting it in my pocket – I did not do this! Max’s phone was on the chair the whole time. I did not go near the chair at any time during or after the talk. False item 4. *{Adam did take Mark’s phone and put it in his pocket and Adam did take the phone from the chair}.***

0 = no mention of phone/stealing

1 = mention of phone but not of it being taken

2 = mention of phone being taken but no identification of perpetrator

e.g. 1: “there was two of them and one of them put his phone on the chair and the other one, uh, and he asked us to remind him if he forgot it and the other person, uh, that he was working with took his phone”

3 = mention of Adam taking Max’s phone

9. **I did borrow Max’s keys during the talk and put it in my pocket. False item 5. *{There were no keys involved – Adam took Max’s phone}***

0 = as this item was a complete confabulation – i.e. did not take place in the original event – all children were allocated a score of zero as there was no specific information available in their prior memory of the event.

- 10. At the end of the talk, Max forgot his coat. False item 6. {Max forgot his jumper, not his coat}**

0 = no mention of Max having a jumper or forgetting something

1 = mention of Max's jumper

2 = mention of Max forgetting his jumper

3 = mention of Mark forgetting his jumper at the end

- 11. When Max forgot his coat, I had to go back to get it. False item 7. {Max returned after he had left and went back to get the forgotten item – not Adam}**

0 = no mention of anyone having to return

1 = mention of someone having to come back but not to collect anything

2 = mention of one of the men returning to get Max's jumper

3 = mention of Mark returning to get his jumper
